SEIR identifies Construction Noise as a potentially significant issue due to:
- Earlier start time
- Extension of construction activities to 2013

Substantial effective mitigation:
- 20-foot temporary sound walls (4,600 linear feet) around the campus
- New permanent wall (900 linear feet) along west side of new access road (College Blvd.), shielding adjacent Raintree residents

Access road (major source of construction noise for adjacent Raintree residents) substantially complete; haul road not needed after April/May

Website provides information on noise monitoring data

Continuous monitoring to ensure compliance
