**Seeking to Understand Student
Engagement and Success**

The Spring 2007 Los Angeles Community Colleges Student Survey has been substantially revised from previous years to place more emphasis on questions of student engagement and success. In addition to questions that increase our understanding of student background, basis of college choice, degree and career goals, special needs and appraisal of college services, the 2007 Survey has expanded sections on classroom experiences, interactions with instructors and other students, participation in campus activities and student evaluation of instructional methodologies and outcomes.

The present report is the first of several planned to present the results of the Survey. This report provides the distribution of students on all questions by college. Subsequent reports will be topical—addressing specific issues and undertaking analysis in depth on a more limited set of questions.

The interpretation of survey results is far from a straightforward process. Some items seem to ask about facts such as in the area of student background. The answer to questions about

Acknowledgements: Completion of the LACCD Student Survey requires the commitment and cooperation of large numbers of faculty, staff and students at all colleges and at the district office. We would like to thank the students who made the effort to fill out the survey, and the faculty who were willing to take valuable classroom time to administer it. At each college, a campus coordinator was assigned the task of distributing and collecting the survey packets from each faculty member. The campus coordinators were: at City, Anna Badalyan and Rebecca Tillberg; at East, Christie Rainey; at Harbor, Rhea Estoya; at Mission, Maury Pearl; at Pierce, Adrian Youhanna and Carol Kozeracki; at Southwest, LaVonne Hamilton; at Trade-tech, Michael Wheeler; at Valley, Cherine Trombley; and at West, Edward Pai. Design and revision of the survey instrument was accomplished by staff of the Office of Institutional Research and Information in consultation with various LACCD faculty, staff, and administrators. Coordination of Survey production at the Office of Institutional Research and Information was accomplished by Research Analyst Dexter Kelly; the sampling procedure was designed and carried out by Senior Research Analyst George Prather.

specifics such as marital status and dependent children are undoubtedly known by the student. Other items ask about parents' education or family income, of which some students may have only approximate knowledge. Finally, questions about disabilities may be ambiguous to the student, and some students may be reluctant to reveal them. Evaluative items are even more problematic. Students surveyed are responding to the specific stimulus of questions and categorized responses. Their responses may be structured by the particular wording of the questions and response choices. Though we may have expectations of what a "good" distribution of responses on an individual item should be, benchmarks should also be appraised by looking at comparative data to understand what the "possible" range of responses may be. This initial report for the Spring 2007 Student Survey provides a first cut of comparison by listing the distribution of answers to all questions by college.

Sampling Methodology

The Los Angeles Community Colleges' Student Survey has been a leader in the adaptation of sample survey methodology to augment student information collected through the normal application and class enrollment processes. Over the years of the Survey, the questionnaire, sampling procedure and administration methodology have been continually refined to provide the highest quality and most relevant information at the lowest possible cost.

The Survey is administered in class to a randomly selected group of classes. This method both minimizes cost, since the survey instrument can be administered in class size groups, and maximizes representation, since non-participation by students on a self-selected basis is largely eliminated. The sampling is accomplished with a random number generator within the SPSS software applied to the semester inventory of classes. All together, the Spring 2007 Survey was administered in 1,303 classes with over 20,000 students responding. This method of sampling is known as a stratified random sample rather than a true random selection and in this method of sampling, determination of significance levels is complex. That issue will be addressed technically in a later report. At this point, it is important only for the reader to understand that though the number of students surveyed is very large, that number by itself can not be relied on in appraising the significance of the results but must be understood in combination with the number of actual sampling points, the classes in which the students were surveyed.

Sampling frames are varied by college so as to ensure large enough samples for the smaller colleges while limiting sizes (and costs) at the large institutions. The general goal is a minimum of 100 classes per college for the former and approximately 175 classes for the latter. The actual numbers of classes within each college in which the survey was administered in Spring 2007 were 172 at City, 192 at East, 117 at Harbor, 126 at Mission, 164 at Pierce, 106 at South, 131 at Trade, 165 at Valley and 130 at West. The number at East is larger because of over-sampling of classes at the Southgate Center and complete coverage of all high school-based classes, as requested by the college.

Each college sample is independent of the others, and the proportion of all students sampled within each college will vary. Thus, for the purposes of looking at results across the whole District, each college sample must be weighted so that its survey sample is the same proportion of the District wide sample as its enrollment is of total District enrollment. Each individual

student response from the larger institutions is weighted more heavily, since a smaller proportion of enrollment in these schools is actually surveyed. Without this weighting, District results would be biased by the disproportionate responses of students in the smaller schools.

The in-class survey methodology requires a second form of weighting as well. Because classes, not individual students, are actually sampled, raw results from the survey will be biased by the disproportionate responses of full-time students--those who take more classes. Consider two students. One takes a full-time load of five three-unit classes; the second enrolls in only one class. The first has five classes which might be included in the sample; the second only one chance to be included. Students taking fuller class loads will thus be more heavily represented in the resulting student sample than they are among the total student body. To correct for this, student responses are also weighted inversely to the number of classes in which they are enrolled. If a student taking only one class were given a weight of 1.00, a student enrolled in five classes would be given a weight of .20.

Raw or unweighted survey figures might be assumed to more closely resemble results which might be obtained if students were sampled on the bases of their full-time equivalent values. The in-class methodology deviates from that standard in two ways, however. First, as an administrative consideration, students are asked **not** to fill out the survey questionnaire a second time if they have already encountered it in another class. It is assumed that being asked to answer the same questions a second or potentially third time would lead to resentment of the whole process and result in non-cooperation in the form of random or patterned selection of answers which would degrade the quality of the overall survey results. Secondly, all **classes**, not units or hours, is the universe from which the sample is drawn. A five-unit class has the same probability of being included in the sample as any one unit class, for example.

Consequently, though the unweighted survey responses are biased in the direction of full-time students, they can not be considered an adequate sample of student FTE. There undoubtedly are a number of survey questions for which the distribution of student responses by FTE would be the more appropriate data, or where the comparison of head count results to student responses by FTE would be revealing. For these purposes a second set of weights are constructed, which "correct" the sample to closely resemble a distribution of student FTE.

In reality, the headcount distributions are very close to those weighted by student FTE, and thus the concern that sampling bias must be corrected before any analysis can be undertaken might seem overstated. Nevertheless, it cannot be guaranteed that on all possible questions substantial differences between full-time and part-time students will not exist, and thus the bias of the unweighted sample might mask the true distribution of responses or otherwise distort the analysis. Questions dealing with aspects of student engagement might be particularly affected by the sampling bias toward full-time students, since they would seem to have much greater opportunity for engagement in college life, and thus the degree of engagement of all students could be over stated. The safest, most conservative approach would be to apply the appropriate correction to the sample in all cases.

Survey Administration

The accuracy of any survey depends not only on the sampling procedure and the care with which results are analyzed in relation to that procedure, but also how close the actual administration of the survey instrument conforms to the theoretical requirements of the sampling frame. As an in-class instrument, the Los Angeles Community Colleges Student Survey depends on several hundred randomly chosen instructors to administer the questionnaire to students, answer their questions about the process, and collect and return the scanable forms for tabulation. Cooperation by instructors has been consistently high over the history of the Survey, particularly considering the disruption to the instructional schedule which administration of the survey entails. This year, surveys were completed and returned in 86% of the classes sampled. By college these figures were 92% at City, 85% at East, 86% at Harbor, 93% at Mission, 90% at Pierce, 80% at Southwest, 72% at Trade, 89% at Valley and 90% at West.

Within those classes in which the survey is administered, participation by the students present is assumed to be universal. That assumption cannot be directly tested, since enrollment in the class, let alone actual attendance, on the particular day within the survey window that the instructor chooses to administer the survey can not be determined. The administration period in Spring 2007 was the last three weeks of March, with a very few classes completing the instrument after that period. After eliminating those students who dropped the surveyed class before the beginning of the period, it appears that at least 63% of all enrolled students completed the survey. That must be considered a minimum proportion, as more students could have dropped between the beginning of the survey period and the actual day of survey administration.

The remaining discount from stated enrollment levels must be due to non-attendance on the survey day. This must be of some concern in the interpretation of the results, again particularly on those questions dealing with student engagement. We would assume that less engaged students are more likely to miss class, and thus may not be available on the given day to respond to the survey. Response rates by grade received in the surveyed class would seem to bear this out. By class, the median response rate by students receiving an A was 79%. In other words, in 50% of the classes, 79% or more of the students who received an A in that class were present for the survey and responding. However, this figure dropped to 67% for those students who received a C and 33% for those students who received an F. A conservative interpretation would be that overall engagement rates will be overstated, since less engaged students were not present to be surveyed.

The questionnaire is designed to be self-administering, and answers are marked directly on the questionnaire. Nevertheless, problems arise which require interpretation of procedures by the instructor. The instructor is given some additional printed instructions, and problems uncovered prior to the actual classroom administration can be referred to the campus survey coordinator or District Office of Institutional Research staff. The principal issue at this stage is adherence to the sampling frame. Incomplete information or late changes in staffing may have resulted in classes being listed in the sample which no longer meet or which have not yet begun at the time of survey administration. Alternatively, an instructor may wish to substitute another class, which would be more convenient, or seem more appropriate (usually meaning larger) to the instructor, than the class identified by the sampling procedure. Maximum effort is extended to persuade instructors to adhere to the sampled list as much as possible, but field adjustments are also made

where it appears possible without significant damage to the fidelity of the sampling frame. The campus coordinators also monitor the return of the completed surveys and follow-up on those not returned, to increase conformity with the sampling frame.

For the actual explanation of the survey to students and resolution of their questions, primary reliance is put on experience of the instructor with previous District surveys or other instruments, and the parallels of the survey process with other classroom procedures, principally testing. No separate training for the instructors is provided. The advantages of this approach are gains in instructor cooperation and lower costs for the survey; the disadvantage is that the reliability of the survey may be weakened by individual instructor deviation from the standard procedures. The result is a reasonable balance between reliability and direct costs of survey administration. The very substantial contribution of instructor and student time which does not get expressed in dollars and cents, however, must also be acknowledged.

Number of respondents and treatment of "No Answer" - In the following tables, "No answer this question" has been included in the responses to each item, wherever appropriate. Variation in the proportion not answering from question to question suggests that this is frequently a reasoned, meaningful response, and needs to be shown to correctly interpret the pattern of responses. However, those students not completing any subsequent items, the survey dropouts so to speak, have been deleted from the percentage calculations at the point at which they ceased to respond, and are thenceforth enumerated as "Ceased Responding". Fortunately, this is not a large number. By the end of the survey, fewer than 6% of the students were classified as "Ceased Responding". The numbers of respondents shown at the end of each section of questions are the unweighted or raw numbers of students persisting to that point in the survey, and are given to provide the reader with some sign posts as to the statistical validity of the survey.

The LACCD Student Survey: 1976-2007

To fulfill their mission, community colleges must know much more about their students than the few facts recorded on the admissions application that each new student fills out at the very beginning of his or her college attendance. From the application we have always learned basic information such as age, sex, ethnicity, planned major, and last high school. In recent years, the application has expanded to include questions on such topics as educational attainment, enrollment status, home language and goals. But both space and time are limited in the application process, and answers may be incomplete or misleading. Also, facts such as goals can change as the student progresses in college. And some information can properly be obtained only on a voluntary basis, outside the quasi-mandatory requirements of the application.

Student Surveys have been devised and administered to obtain such information as: personal and household income, parents' educational level, degree and career goals, educational interests, evaluation of student services, and many other topics in response to varying and increasing informational needs. Survey data has been essential to plan educational programs, complete grant applications, develop and modify student services, change scheduling of classes and semesters, anticipate the results of increases in tuition, and for many other purposes. The usefulness of survey data has increased over the years, and the focus of survey questions has changed and shifted in response to changing needs. But some types of information have been collected from the beginnings, and can be tracked.

The Los Angeles Community College District first surveyed its own students in Fall 1976. The survey was administered at all colleges, and was designed to furnish a full picture of the LACCD student by identifying goals, levels of college preparation, extra-curricular interest, transportation patterns, employment work loads, and income levels. Other questions reiterated items from the application. In 1978 a new feature was added to the Survey, an evaluation of all services to students, in the form of a grading sheet. A significant innovation of the Fall 1980 Survey was a breakdown of results by college, and a comparison of college responses in bar graphs. The differences between colleges were revealed, and colleges could use the survey information for grant applications. Also included in the 1980 survey was a question on the language spoken at home which began to give a picture of the increasing proportion of students who were not native speakers of English. Basically the same survey was repeated in Fall 1982.

In Spring 1984, a survey was hastily designed and administered for a specific purpose; to gauge the impact of an impending per-unit tuition on student enrollment. This survey was a shortened version of the earlier ones, starting with basic demographic and goals questions, then focusing in detail on personal income, expenditures, and financial needs related to college attendance. The fee-impact questions were also incorporated into the full blown Survey conducted in Fall 1984.

The next full-scale Student Survey was administered in Spring 1987. An additional goals question was included which asked the students how their courses were related to their careers. It was also possible with the 1987 Survey to compare the proportion of students working with results from the previous decade. The native language question was expanded to list nine different languages in response to the growing number of students who were immigrants. Finally, a question asking about parent's education identified first-generation college students and enabled the analysis of their particular characteristics.

In the Spring 1989 Survey, respondents were asked for the first time to give their social security number so that their survey responses could be matched by the computer with information provided in the application. This innovation relieved the survey of the need to ask for demographic data, courses taken, hour load, units completed, grades and other facts already entered in the database. Space was thereby freed for questions on such matters as: time spent in the library; parent's educational level; measures of student progress, including obstacles, consultation with counselors, and changes in educational goals and majors. Even with the elimination of the database-redundant questions, the 1989 Survey was longer than its predecessor by twenty-five questions. But the response rate remained high.

The Survey was moved back to the Fall Semester in 1990. Questions were added on wages and participation in services. Also introduced was a question detailing the length of time the student's family had resided in the United States. Responses to this question have greatly facilitated the analysis of the effects of high levels of immigration on the college system. An important innovation of the 1990 Survey was the weighing of student responses, to compensate for the larger proportions of surveyed students in the smaller colleges, and the preponderance of full-time students among respondents (see Sampling Methodology).

After a three-year interval, the Fall 1993 Survey was administered to all vocational students in addition to the non-vocational students in the regular survey sample. The two overlapping groups could be separated in assessing reports. There were significant additions of questions that addressed the extent to which the college met the student's needs, the helpfulness of college

faculty and staff, gains in skills and knowledge and other details of the college experience that had an impact on the student's success and fulfillment. It was also possible to delete the native language question, since the standard college application had now caught up with the survey, and requested that information of the student at entrance.

Perhaps the most significant innovation of the 1993 Survey, however, was the provision of computer files to each of the colleges for further analysis by the research personnel on campus. The files were produced in an SPSS (Statistical Package for the Social Sciences) format with extensive labeling and documentation which made it possible to quickly analyze questions from an individual college perspective using personal computer equipment and software. This process was continued in the two subsequent surveys, administered in 1996 and 2000, in which coverage of emerging areas such as information competency was expanded.

The next surveys, given in Fall 2002 and Spring 2005, were produced and administered entirely by college researchers, without coordination by the District Research Office, but the survey instruments were virtually identical to the one used in 2000. There was no attempt to analyze the data at the District level, but each college used their data for such purposes as grant applications and other forms of information requests. This year the Survey was designed with a districtwide perspective. Many of the variables are similar to the ones used in past surveys, but with a shift in focus from the way students feel about college activities and services, to the extent that they are involved in the many aspects of college life.

As stated above, surveyors have attempted to identify individuals by number since 1989, in order to match characteristics obtained from other sources with responses to the survey questions. This year, the social security number could no longer be asked of students. Respondents were asked to record the student ID assigned to them by the colleges. This was a number many could not remember as easily as their social security number. But the rate of ID inclusion was little changed, and only a small portion of respondents remain "anonymous" in this respect. This consistency illustrates a constant characteristic of the LACCD Student Survey throughout its more than thirty years of administration; a high rate of participation and response. In spite of the minor inconveniences of administering and completing the Survey, both faculty and students have demonstrated an understanding of its need and benefits to the colleges and themselves.
